

Project Plan

Pareto Version

Implementation of Pareto Principle:

Project Timelines:

- The most critical task is to navigate customers to the hotel. A Lot of time is required for this functionality.
- And technical staff needed for its smooth functioning.
- Other functionalities are not more than crud operation. Saving room photos and saving customer's feedback is not that difficult and critical.
- 20% time for photos, feedback functionality and 80% time for navigation functionality.

Risk Management:

- Security is a big risk for this project.
- There should be authentic feedback about the hotel.
- Visitors should not be able to give any feedback.
- And photos of the room should be uploaded and updated by the hotel management.
- These 20% risks of the project should not be taken lightly. Otherwise it can lead to 80% of problems of a project.

Resource Management:

- The critical functionality of the project will need technical staff.
- So, a small team will be assigned for simple crud operations.
- For security and navigation functionality, big and technical staff will be assigned.
- In short, 20% team will be assigned for simple crud operations and 80% technical staff will be assigned for technical part of the project.

Productivity Period:

- The peak time of productivity is early in the morning.
- And the worst time of productivity is after lunch.
- Hence maximum work will be planned early in the morning.
- Meetings, prayer breaks and lunch breaks will be included in the time period for rest and meditation.
- The short trips will also be planned to work back with motivation and fresh mind.
